

GREENBOND™.

Made of FSC® paper and polyester film, this material is a standard UV-printable material. As its name indicates, GreenBond™ has been developed as an alternative to aluminium composite (ACM) signs.

It has identical applications and resemblance to ACM but has a carbon footprint 41 % lower. Therefore, it covers a huge gap in the signage market as an eco-friendly and versatile product with possibilities equal to those of ACM.

GreenBond™ Interior product line consist of:

- › Wall signs
